

ACC. NO. : NJ10-177
 NAME : Ms. SUBHRA DEY
 AGE / SEX : 65 Year(s) / Female
 REFERRED BY : Dr. T K KUNDU - 77538(WBMC)

DRAWN : 10.10.2025 09:09 AM
 RECEIVED : 10.10.2025 09:09 AM
 REPORTED : 10.10.2025 04:28 PM
 CENTER : BST

M. R. I. OF BRAIN

PROCEDURE - T1 (axial,sagittal), T2 (axial, Sagittal, Coronal) and Flair axial scans were taken.

Special sequences: DWI EPI. GRE: T2 Axial.

FINDINGS

Cranio-vertebral junction :

Cranio-vertebral junction appears normal in anatomy.
 Cervico-medullary cord is normal in signal intensity.

Posterior fossa :

Brain stem and cerebellum are normal in size, shape and signal intensity.
 Fourth ventricle including its outlet foramina and posterior fossa cisterns appear normal.
 CP angle cistern & IAM are normal without any mass.

Supra-tentorial :

A tiny area of old microbleed noted in the left thalamus, left frontal and parietal lobe.

Multifocal T2 hyperintense lesions are seen in cerebral subcortical and deep white matter.

There is no restricted diffusion.

White matter tracts are normal in size and signal intensity.

Corpus callosum is normal in size and shape with normal signal intensity.

Right thalamus, basal ganglia are normal in size and signal intensity.

Sellar structures are normal. There is no SOL in sella and juxtaseilar region.

Supra-tentorial ventricles are **enlarged** with septum in midline.

Sulci, fissure & Cisterns appear enlarged.

IMPRESSION - MRI study of Brain is suggestive of

- **Cerebral subcortical and deep white matter multifocal chronic ischaemic lesion (Microangiopathic changes).**
- **Diffuse cerebral atrophy.**
- **Left thalamus, frontal and parietal tiny area of old microbleed.**

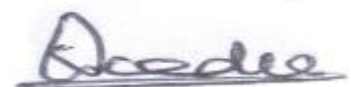

Incidental finding: Right maxillary sinusitis.

Please correlate clinically.
